Studies in animal models and cell culture, show the cilium to be like a cell antenna, harbouring critical components of Shh, Wnt, Hippo, Notch and mTor signalling [7]. This, and the databases and interfaces to analyse these data, will be a significant boost to the global ciliary and ciliopathy research community. Among several important paradigms that have emerged has been the recognition that allelism at a single locus cannot fully explain phenotypic variability, and that ciliopathy loci can contribute causal and epistatic modifiers across the ciliopathy spectrum.

As mentioned in Introduction, centrosome components in the MII oocyte are crucial. Imbalanced transport can lead to pathologies related to centrosome and microtubule functions as well as to failures in organelle and vesicle distribution. The molecular mechanisms of ciliopathies. New molecular analysis technologies have facilitated the identification of novel protein networks as therapeutic targets.

Cutting edge new information is balanced with background information that is
